

## Technical Data Sheet

Note: For safe, efficient blasting, read and follow the owner's manual and seek training for everyone who will use this equipment.

## Purpose

A blast nozzle accelerates the air and abrasive as the mixture exits the end of the hose. The taper and length of the nozzle's inlet and outlet determine the pattern and velocity of the abrasive exiting the nozzle. The composition of the liner material determines its resistance to wear.

## Requirements for Operation

Nozzles are sized by the diameter of their orifices in $1 / 16$-inch increments. A No. 2 nozzle has a $2 / 16$-inch ( $1 / 8$-inch) orifice, a No. 3 nozzle has a ${ }^{3 / 16}$-inch orifice, etc. The size of the nozzle orifice determines abrasive and air consumption. Air consumption is measured in cubic feet per minute (cfm) at a given pressure. See the air and abrasive consumption chart on the back of this page.

When choosing a nozzle, consider the amount of available air in cfm, the capacity of the blast machine and the inside diameter of the piping, the blast and air hoses. For optimal performance, these elements must be compatibly sized. See the chart on the back of this page.

If too large a nozzle is used, low blast pressure and rapid wear on the blast hose will occur. If too small a nozzle is used, smooth media flow will be difficult to achieve.

## Description of Operation

The operator attaches the nozzle to the nozzle holder. Threaded nozzles require a holder with matching threads. CJD, CSD and CXD nozzles have 1 1/4-inch threads. TXD nozzles have Contractor threads ( 50 mm ). Flange-style nozzles use a quick-coupling nozzle holder,

## Description

Blast nozzle with venturi shape tungsten carbide liner and metal jacket. Thread size and entry dimensions vary with nozzle series.

which couples to most quick couplings. Clemco's nylon quick couplings have built-in lock-springs to keep the couplings from becoming uncoupled. If other couplings are used, the operator must install pins to secure the couplings.

With all related equipment correctly assembled and tested, the operator points the nozzle at the surface to be blasted and presses the remote control handle to begin blasting. The operator holds the nozzle at the appropriate distance and angle to the surface. The longer the nozzle, the greater the stand-off distance. The normal range for short-venturi nozzles is 12 to 18 inches and 18 to 36 inches for longventuri nozzles. The correct distance will be established for each application.

The operator must check the nozzle and nozzle washer daily for damage or wear and replace as necessary. The nozzle should be replaced when the orifice wears 1/16-inch larger than its original size.

## Advantages

- Rugged and durable aluminum jacket
- Tungsten carbide is the most rugged and durable and provides the best value in a liner material.
- Expected wear-life when blasting with expendable abrasives is approximately 300 hours.
- TXD nozzles with large Contractor threads eliminate galling or binding of the threads in the holder.

## Nozzles

## Tungsten Carbide Lined Metal Jacketed

Short Venturi: CJD<br>Long Venturi: CSD, TXD, SDX, CXD

## SDX shown

- CXD nozzles provide smooth transition from $11 / 4$-inch blast hose to their $11 / 4$-inch entry for users who prefer $11 / 4$-inch fine-thread nozzles.

## Replacement Parts

Description
Stock No.
Nozzle washers shown on reverse.
Flanged nozzle coupling lock-springs (25)

Authorized Distributor:

Based on abrasives weighing 100 pounds per cubic foot, and compressor horsepower ( hp ) based on 4 to 4.5 cfm per horsepower.
NOTE: Figures vary depending upon working conditions. The effects of nozzle wear on air consump-tion must be considered when selecting nozzles and the compressors that support them.
